

Webpage Maintainer Workflow

A practical, no-cost process for collecting seminar information, publishing talks, and keeping the Technion Fractals Seminar website reliable.

Operating principle

Speakers submit information through Google Forms. The maintainer reviews it, enters approved content in Pages CMS, and saves it to GitHub. GitHub Actions builds and deploys the static Astro website automatically.

From submission to publication

Routine maintenance

- Review new Google Form responses.
- Resolve missing or ambiguous information with the speaker.
- Create or update the talk in Pages CMS as a draft.
- Check the preview and run the local build for substantial changes.
- Publish the talk and confirm the deployment completes.
- Open the public page and verify the final result.

Responsibility split

Speaker

Provides accurate title, abstract, name, and contact details through the submission form.

Content maintainer

Reviews wording, schedule, venue, links, and publication status in Pages CMS.

Technical maintainer

Maintains the Astro project, dependencies, deployment workflow, and repository configuration.

Maintaining content in Pages CMS

Open app.pagescms.org, select [technionfractals/technionfractals.github.io](https://technionfractals.github.io), and use the Talks collection or Seminar settings. Saving in the CMS creates a Git commit and triggers deployment.

Talk entry checklist

Field	Maintainer check
Title	Use the final public title; preserve mathematical notation.
Speaker	Confirm spelling, affiliation, and optional homepage URL.
Schedule	Use local Technion time; confirm date, start time, and end time.
Venue	Use the compact pattern RM 864, Amado.
Abstract	Proofread Markdown and test inline or display LaTeX.
Materials	Upload public files or add verified external links.
Status	Keep draft while reviewing; publish only when ready.

Technical workflow

Use local development when changing layout, code, configuration, or dependencies.

```
git pull --ff-only
pnpm install
pnpm dev
pnpm build
```

After a successful build:

```
git add --all
git commit -m "describe the change"
git push origin main
```

Publication and recovery

- Check the GitHub Actions run after each save or push.
- Verify the public site after the deployment succeeds.
- If a content change is wrong, correct it in Pages CMS and save again.
- If a code deployment fails, inspect the Actions log and reproduce with `pnpm build` locally.
- Prefer a new corrective commit over rewriting published history.

Prototype readiness note

The repository currently includes generated test talks in `src/lib/prototypeTalks.ts`. Pages CMS is configured and can edit source records, but the test-data layer should be removed before real seminar content becomes authoritative.
